

dna replication methods in pdf

The mechanism of DNA replication is a tightly controlled process, which occurs at specific times during the cell cycle. It requires a set of proteins and enzymes, and requires energy in the form of ATP. Two basic steps: Initiation and Elongation. Two basic components: template and primer.

DNA replication. Basic Mechanisms of Replication DNA replication is semiconservative. We begin our investigation by describing the basic model for how nucleotides are joined in a specific order during DNA replication. By the early 1950s, it was clear that DNA was a linear string of deoxyribonucleotides.
